#### What is IoT...

The Internet of Things (IoT) is a scenario in which objects, animals or people are provided with unique identifiers and the ability to transfer data over a network without requiring human-to-human or human-to-computer interaction.

## Open Source Operating Systems for the IoT

- ► FreeRTOS
- ► RIOT
- ► Contiki
- ► TinyOS
- ► Embedded Linux
- ► OpenWSN

#### FreeRTOS

- ► FreeRTOS is designed to be small and simple.
- ▶ The kernel itself consists of only three or four C files.
- ▶ It provides methods for multiple threads or tasks, mutexes, semaphores and software timers.
- ► Key features are very small memory footprint, low overhead, and very fast execution.

#### **RIOT**

- ► RIOT is a real-time multi-threading operating system.
- ► RIOT is based on design objectives including:
  - Energy-Efficiency
  - Reliability
  - Real-Time Capabilities
  - Small Memory Footprint
  - Modularity
  - Uniform API Access independent of the underlying hardware (this API offers partial POSIX compliance)

#### Contiki

- Contiki is an open source operating system for networked, memory-constrained systems
- ► Contiki provides three network mechanisms:
  - The uIP stack, which provides IPv4 networking,
  - The uIPv6 stack, which provides IPv6 networking,
  - The Rime stack, which is a set of custom lightweight networking protocols designed specifically for low-power wireless networks.

# **TinyOS**

- ► TinyOS is a component-based operating system and platform targeting wireless sensor networks.
- ► TinyOS is an embedded operating system written in the nesC programming language as a set of cooperating tasks and processes.

#### **Embedded Linux**

- ► Embedded Linux is created using OpenEmbedded, the build framework for embedded Linux.
- ▶ OpenEmbedded offers a best-in-class cross-compile environment.

## **OpenWSN**

The goal of the OpenWSN project is to provide open-source implementations of a complete protocol stack based on Internet of Things standards, on a variety of software and hardware platforms.

# Comparison

| OS      | Min RAW       | Min ROM        | C Support       | C++ Support  |  |
|---------|---------------|----------------|-----------------|--------------|--|
| Contiki | < 2 <i>kB</i> | < 30 <i>kB</i> | Partial support | No support   |  |
| Tiny OS | < 1kB         | < 4 <i>kB</i>  | No support      | No support   |  |
| Linux   | $\sim 1 MB$   | $\sim 1 MB$    | Full support    | Full support |  |
| RIOT    | $\sim 1.5$ kB | $\sim 5kB$     | Full support    | Full support |  |

# Comparison

| OS      | Multi-Threading | Modularity      | Real-Time       |
|---------|-----------------|-----------------|-----------------|
| Contiki | Partial support | Partial support | Partial support |
| Tiny OS | Partial support | No support      | No support      |
| Linux   | Full support    | Partial support | Partial support |
| RIOT    | Full support    | Full support    | Full support    |

# Why Not Linux?

#### Real-Time Linux

Controlling a laser with Linux is crazy, but everyone in this room is crazy in his own way. So if you want to use Linux to control an industrial welding laser, I have no problem with your using PREEMPT\_RT.

## Why Not Linux?

- ► Linux certainly is a robust, developer-friendly OS
- ▶ Linux has a disadvantage when compared to a real-time operating system:
  - Memory footprint
  - It simply will not run on 8 or 16-bit MCUs

# Close Source Operating Systems for the IoT

- ► ARM mbed
- ► Huawei LiteOS

## Requirements for IoT

- Scalability
- Modularity
- Connectivity
- Reliability

► Can you build an IoT system with familiar Web technologies?

- ► Can you build an IoT system with familiar Web technologies?
- ► Yes you can, although the result would not be as efficient as with the newer protocols.

- · Inefficient content encoding
- · Huge overhead, difficult parsing
- · Requires full Internet devices

# Internet of Things Tens of bytes **Web Objects CoAP DTLS UDP 6LoWPAN**

- · Efficient objects
- Efficient Web
- Optimized IP access

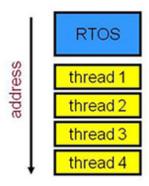

| Protocol        | Transport | Messaging                  | 2G,3G,4G<br>(1000's) | LowPower<br>and Lossy<br>(1000's) | Compute<br>Resources   | Security             | Success<br>Stories          | Arch                 |

### Modularity

► IoT device will require a modular operating system that separates the core kernel from middleware, protocols, and applications.

#### Multi-Tasking, Thread Model

- ▶ Most RTOS products on the market are thread model.
- Tasks are now called threads.
- ► All the tasks code and data occupy the same address space, along with that of the RTOS itself.
